

## US Audio Multiplexing Decoder

### Description

The CXA2174S is an IC designed as a decoder for the Zenith TV Multi-channel System and also corresponds with I<sup>2</sup>C BUS. Functions include stereo demodulation, SAP (Separate Audio Program) demodulation, dbx noise reduction and sound processor. Various kinds of filters are built-in this IC. Adjustment, mode control and sound processor control are all executed through I<sup>2</sup>C BUS.

### Features

- Alignment-free VCO and filter
  - Audio multiplexing decoder
  - dbx noise reduction decoder
  - sound processor
    - One external input
    - Volume control
- are all included in a single chip. Almost any sort of signal processing is possible through this IC.
- Input level, separation adjustments and each mode control are possible through I<sup>2</sup>C bus.

### Applications

TV, VCR and other decoding systems for US audio multiplexing TV broadcasting

### Structure

Bipolar silicon monolithic IC

Electrical Characteristics Measurement Circuit

## Adjustment Method

### 1. ATT adjustment

- 1) TEST BIT is set to "TEST1 = 0" and "TEST-DA = 0".
- 2) Input a 100Hz, 245mVrms sine wave signal to COMPIN and monitor the LSOUT-L output level. Then, adjust the "ATT" data for ATT adjustment so that the LSOUT-L output goes to the standard value (490mVrms).
- 3) Adjustment range:  $\pm 20\%$   
Adjustment bits: 4 bits

### 2. Separation adjustment

- 1) TEST BIT is set to "TEST1 = 0" and "TEST-DA = 0".
- 2) Set the unit to stereo mode and input the left channel only signal (modulation factor 30%, frequency 300Hz NR-ON) to COMPIN. At this time, adjust the "WIDEBAND" adjustment data to reduce LSOUT-R output to the minimum.
- 3) Next, set the frequency only of the input signal to 3kHz and adjust the "SPECTRAL" adjustment data to reduce LSOUT-R output to the minimum.
- 4) The adjustments in 2 and 3 above are performed to optimize the separation.
- 5) "WIDEBAND"                                      "SPECTRAL"  
Adjustment range:  $\pm 30\%$                       Adjustment range:  $\pm 15\%$   
Adjustment bits: 6 bits                      Adjustment bits: 6 bits

## Description of Registers

### Control registers

Register	Number of bits	Classification*1	Standard setting	Contents
ATT	4	A	9	Input level adjustment
SPECTRAL	6	A	1F	Adjustment of stereo separation (3kHz)
WIDEBAND	6	A	1F	Adjustment of stereo separation (300Hz)
TEST-DA	1	T	0	DAC test mode
TEST1	1	T	0	Test mode
EXT1	1	U	0	Selection of TV mode or external input mode
NRSW	1	U	0	Selection of the output signal (Stereo mode, SAP mode)
FOMO	1	U	0	Forced MONO (Left channel only is MONO during SAP output.)
M1	1	U	1	Selection of LSOUT mute function ON/OFF (0: mute ON, 1: mute OFF)
SAPC	1	S	0	Selection SAP mode or L + R mode according to the presence of SAP broadcasting
VOL-L	1	U	3F	Left channel volume control
VOL-R	1	U	3F	Right channel volume control

\*1 Classification U: User control

A: Adjustment

S: Proper to set

T: Test

### Status registers

Register	Number of bits	Contents
PONRES	1	POWER ON RESET detection; 1: RESET
STEREO	1	Stereo discrimination of the COMPIN input signal; 1: Stereo
SAP	1	SAP discrimination of the COMPIN input signal; 1: SAP
NOISE	1	Noise level discrimination of the SAP signal; 1: Noise

### Description of Control Registers

ATT	(4):	Perform input level adjustment. 0 = Level min. F = Level max.
SPECTRAL	(6):	Perform high frequency (fs = 3kHz) separation adjustment. 0 = Level max. 3F = Level min.
WIDEBAND	(6):	Perform low frequency (fs = 300Hz) separation adjustment. 0 = Level min. 3F = Level max.
TEST-DA	(1):	Set DAC output test mode. 0 = Normal mode 1 = DAC output test mode In addition, the following output are present at Pin 2. LSOUT-L (Pin 2): DA control DC level
TEST1	(1):	Monitor SAPBPF and NRBPF output 0 = Normal mode 1 = SAPBPF, NRBPF output In addition, the following outputs are present at Pins 1 and 2. LSOUT-L (Pin 2): SAP BPF OUT LSOUT-R (Pin 1): NR BPF OUT
EXT1	(1):	Select TV mode or external input mode 0 = TV mode 1 = External input mode
NRSW	(1):	Select stereo mode or SAP mode 0 = Stereo mode 1 = SAP mode
FOMO	(1):	Select forced MONO mode 0 = Normal mode 1 = Forced MONO mode
M1	(1):	Mute the LSOUT-L and LSOUT-R output. 0 = Mute ON 1 = Mute OFF

- SAPC (1): Select the SAP signal output mode  
When there is no SAP signal, the conditions for selecting SAP output are selected by SAPC.  
0 = L + R output is selected  
1 = SAP output is selected
- VOL-L (6): LSOUT-L output signal level control  
0 = Volume min.  
3F = Volume max.  
-1.25dB/STEP
- VOL-R (6): LSOUT-R output signal level control  
0 = Volume min.  
3F = Volume max.

**Note**

(SAP) : The SAPOUT output signal is soft muted (approximately -7dB).

The signal is soft muted when NOISE = 1.

\* : Don't care.

\*1 SAP or NOISE discrimination may be made during MONO or STEREO input when the noise is inputted in the weak electric field.

Then microcomputer reads "NOISE" status from IC and decides whether SAP is outputted.

"NOISE" status rises earlier than "SAP" status when the amount of noise is increased to COMPIN.

**Fig 3. dbx-TV block**

(1) L + R (MAIN)

After the audio multiplexing signal input from COMPIN (Pin 11) passes through MVCA, the SAP signal and telemetry signal are suppressed by STEREO LPF. Next, the pilot signals are canceled. Finally, the L – R signal and SAP signal are removed by MAIN LPF, and frequency characteristics are flattened (de-emphasized) and input to the matrix.

(2) L – R (SUB)

The L – R signal follows the same course as L + R before the pilot signal is canceled. L – R has no carrier signal, as it is a suppressed-carrier double-sideband amplitude modulated signal (DSB-AM modulated). For this reason, the pilot signal is used to regenerate the carrier signal (quasi-sine wave) to be used for the demodulation of the L – R signal. In the last stage, the residual high frequency components are removed by SUB LPF and the L – R signal is input to the dbx-TV block via the NRSW circuit after passing through SUBVCA.

(3) SAP

SAP is an FM signal using 5fH as a carrier as shown in the Fig. 1. First, the SAP signal only is extracted using SAP BPF. Then, this is subjected to FM detection. Finally, residual high frequency components are removed and frequency characteristics flattened using SAP LPF, and the SAP signal is input to the dbx-TV block via the NRSW circuit. When there is no SAP signal, the Pin 20 output is soft muted.

(4) Mode discrimination

Stereo discrimination is performed by detecting the pilot signal amplitude. SAP discrimination is performed by detecting the 5fH carrier amplitude. NOISE discrimination is performed by detecting the noise near 25kHz after FM detection of SAP signal.

(5) dbx-TV block

Either the L – R signal or SAP signal input respectively from ST IN (Pin 18) or SAP IN (Pin 21) is selected by the mode control and input to the dbx-TV block.

The input signal then passes through the fixed de-emphasis circuit and is applied to the variable de-emphasis circuit. The signal output from the variable de-emphasis circuit passes through an external capacitor and is applied to VCA (voltage control amplifier). Finally, the VCA output is converted from a current to a voltage using an operational amplifier and then input to the matrix.

The variable de-emphasis circuit transmittance and VCA gain are respectively controlled by Each of effective value detection circuits. Each of the effective value detection circuits passes the input signal through a predetermined filter for weighting before the effective value of the weighted signal is detected to provide the control signal.

(6) Matrix, TVSW

The signals (L + R, L – R, SAP) input to "MATRIX" become the outputs for the ST-L, ST-R, MONO and SAP signals according to the mode control and whether there is ST / SAP discrimination.

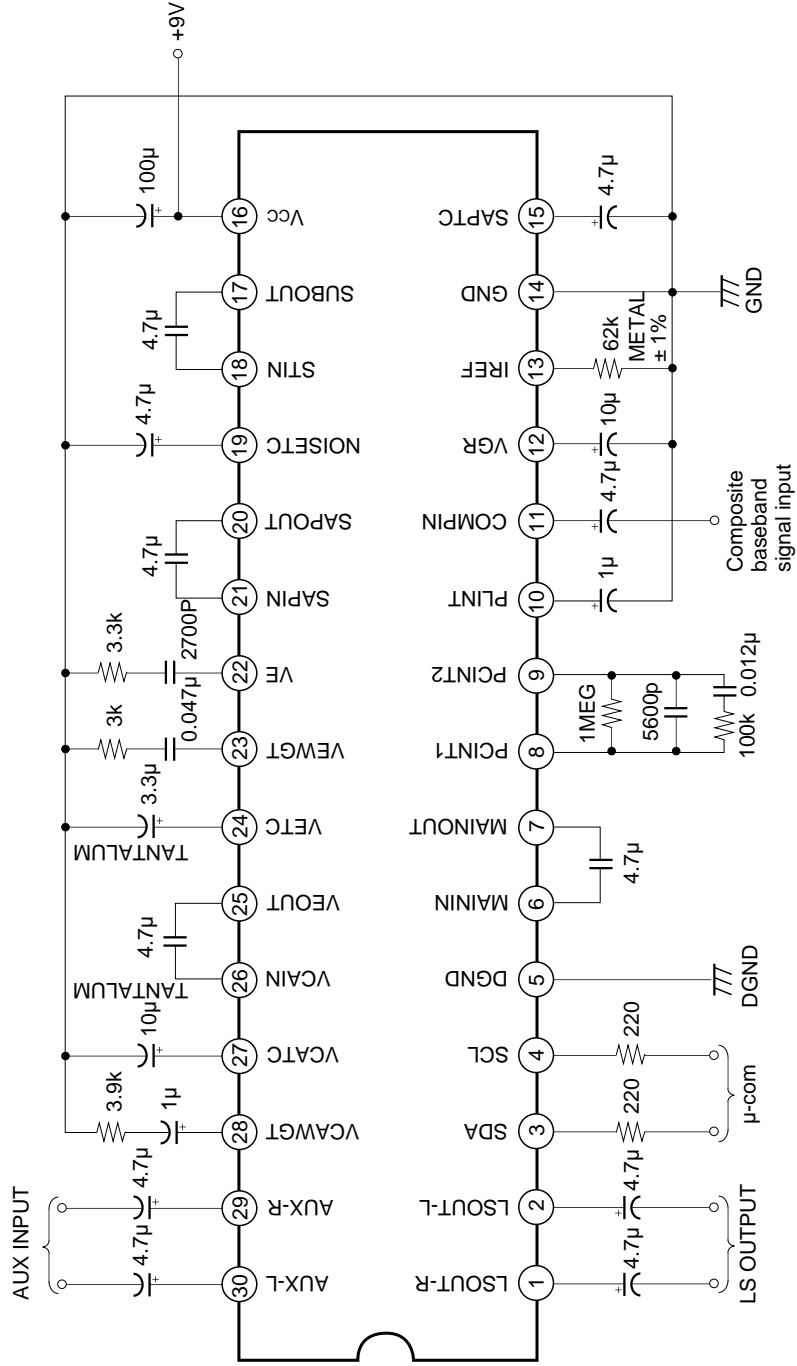

"TVSW" switches the "MATRIX" output signal and external input signal.

(7) Others

"MVCA" is a VCA which adjusts the input signal level to the standard level of this IC.

"Bias" supplies the reference voltage and reference current to the other blocks. The current flowing to the resistor connecting IREF (Pin 13) with GND become the reference current.

Application Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

I<sup>2</sup>C BUS load conditions: Pull-up resistor 4kΩ (Connect to +5V)  
 Load capacity 200pF (Connect to GND)

**I<sup>2</sup>C BUS Control Signal**

**I<sup>2</sup>C BUS Signal**

There are two I<sup>2</sup>C signals, SDA (Serial DATA) and SCL (Serial CLOCK) signals. SDA is a bidirectional signal.

- Accordingly there are 3 values outputs, H, L and Hi-Z.

- I<sup>2</sup>C transfer begins with Start Condition S and ends with Stop Condition P.

• I<sup>2</sup>C data Write (Write from I<sup>2</sup>C controller to the IC)

• I<sup>2</sup>C data Read (Read from the IC to I<sup>2</sup>C controller)

• Read timing

\* Data Read is performed during SCL rise.
